## **ABSTRACT**

The invention relates to a keratin fibre makeup composition having

- 5 a solids content of more than 45% of the total weight of the composition; and
  - a rheological profile such that, for a shear gradient range from  $10^{-2}$  to  $10^3$  s<sup>-1</sup>, the ratios of the change in shear gradient to the change in applied shear stress (the said ratio being written  $\frac{\Delta \dot{\gamma}}{\Delta \tau}$ ) are not more than 7; the said composition being capable of undergoing shear stresses without breaking up over the entire breadth of the said shear gradient range.

The invention allows a smooth and continuous 15 deposition of product on the fibre.
